

MmvIm4SCD: multimodal severity & survival prediction in Sickle Cell Disease

Synthetic-cohort benchmark (n=2,000) - jointly trained cross-entropy + Cox partial likelihood

Strong clinical-only baselines:

- Logistic regression AUROC = 0.894

Findings (Tables 2-5, Figures 6-8):

- Cox PH C-index = 0.671

- Clinical features dominate decision-time importance
- Fusion strategy differences fall within seed variance
- Subgroup gaps motivate ancestry/age-aware modelling
